Abstracts

Fluoride flux for aluminum brazing is a specialized flux material designed for the brazing process of aluminum and its alloys. It mainly consists of fluoride compounds that effectively remove the oxide layer on the aluminum surface, reducing the formation of oxides during the brazing process and thereby improving the strength and quality of the joint. The fluoride flux has a low melting point and excellent wettability, allowing the brazing filler metal to spread evenly over the aluminum surface and ensuring strong bonding. It is widely used in industries such as automotive, air conditioning, and electronics manufacturing, playing a crucial role in achieving high-quality brazed joints.

The global Fluoride Flux for Aluminum Brazing market size was estimated at USD 352.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
