The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Fluoride Removal Filter competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the production of defluorination filters will reach 15,139 units, with an average selling price of US\$15,000 per unit. The annual production capacity of a single-line defluorination filter is approximately 1,000 units, with a gross profit margin of approximately 31.2%. A defluorination filter is a water treatment device used to remove fluoride from water. It mainly removes excess fluoride ions from water through principles such as adsorption and ion exchange, so that the water quality meets the standards for safe drinking or industrial use. Its core component is a filter tank filled with adsorbents such as activated alumina. By controlling the direction of water flow and the regeneration process of the adsorbent, a continuous and stable defluorination function is achieved. This equipment is widely used in drinking water treatment, industrial wastewater treatment and other fields, and is one of the important facilities to ensure water quality safety. The upstream raw materials of defluorination filters include valve body materials, membrane element related materials, ion exchange resins, etc. The midstream is the defluorination filter manufacturer, and the downstream is mainly in the drinking water treatment, industrial wastewater treatment and other industries.

The global Fluoride Removal Filter market size was estimated at USD 228.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
