Abstracts

Fluorinated immersion cooling fluid is a specialized liquid used to manage heat in high-performance computing and electronic systems. This type of fluid is designed to efficiently transfer heat away from electronic components, allowing for more effective cooling than traditional air cooling methods. The fluid's fluorinated chemical composition makes it non-conductive and non-flammable, ensuring it can safely interact with electronic devices without causing electrical shorts or fires. Fluorinated fluids have excellent thermal stability and a high boiling point, enabling them to absorb and dissipate large amounts of heat. They are used in various applications, including data centers, supercomputers, and other electronics requiring advanced thermal management.

The global Fluorinated Immersion Cooling Fluid market size was estimated at USD 139.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 14.50% during the forecast period.
