Abstracts

Fluorinated solar backsheet refers to a specialized multilayer polymeric film, predominantly incorporating polyvinyl fluoride (PVF) or polyvinylidene fluoride (PVDF) as key outer layers, engineered to serve as the protective rear-side component of photovoltaic (PV) modules. Its primary functions include providing electrical insulation, mechanical support, and resistance to environmental stressors such as moisture ingress, UV radiation, temperature fluctuations, and chemical exposure, thereby ensuring long-term durability, performance retention, and safety of solar panels. These backsheets are characterized by their superior weatherability, dielectric strength, and adhesion properties compared to non-fluorinated alternatives, making them particularly critical in harsh climatic conditions and high-reliability applications.

The global Fluorinated Solar Backsheet market size was estimated at USD 1245.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
