Abstracts

Fluoropolymer for semiconductor manufacturing is a class of materials with a unique molecular structure, where the arrangement of fluorine atoms endows them with exceptional chemical inertness, thermal stability, and low surface energy, making them crucial in the semiconductor fabrication process. These polymers typically exhibit outstanding resistance to etching and chemical corrosion, protecting the fine structures of semiconductor devices under extreme processing conditions while maintaining mechanical strength and flexibility. Furthermore, fluoropolymers used in semiconductor manufacturing must meet stringent technical requirements, including production under high purity conditions to ensure they do not negatively affect the electrical performance of semiconductor devices, and they also need to possess good processability to enable precise coating and patterning at the micro and nanoscale levels during fabrication.

The global Fluoropolymer for Semiconductor Manufacturing market size was estimated at USD 251.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
