Report Overview

Fluoroscopy and C-arms technology refer to imaging techniques that involve the use of X-rays to obtain real-time moving images of the internal structures of a patient.

Fluoroscopy is commonly used in medical procedures such as angiography, orthopedic surgery, and gastrointestinal studies, while C-arms are specialized X-ray machines that provide high-resolution images for surgical guidance. These technologies play a crucial role in modern healthcare by enabling physicians to visualize internal organs and tissues in real-time, aiding in diagnosis and treatment planning.

The market for fluoroscopy and C-arms technology is experiencing significant growth driven by several key factors. One of the primary drivers is the increasing prevalence of chronic diseases and the growing demand for minimally invasive procedures.
