Report Overview:

Fluorosurfactant is a surfactant with a fluorocarbon chain as a non-polar group, that is, a fluorine atom partially or completely replaces the hydrogen atoms on the hydrocarbon chain. Fluorocarbon surfactants have high surface activity, high thermodynamic and chemical stability. Fluorosurfactant can realize low surface tension with smaller adding amount as compared with generally used hydrocarbon surfactants or silicone surfactants. In other words, this is a surfactant that has a low critical micelle concentration and a low critical surface tension. These characteristics are derived from the following facts: the atomic radius of the fluorine atom is slightly larger than that of the hydrogen atom; and a high electronegativity of the fluorine atom enables the formation of a strong carbon-fluorine bond thereby forming the perfluoroalkyl group having weak intermolecular force and small interaction with other substances.

The Global Fluorosurfactants Market Size was estimated at USD 523.21 million in 2023 and is projected to reach USD 635.73 million by 2029, exhibiting a CAGR of 3.30% during the forecast period.
