Abstracts

Fluphenazine decanoate is a long-acting injectable antipsychotic medication belonging to the phenothiazine class, specifically formulated as a decanoate ester prodrug to enable sustained release over several weeks following intramuscular administration. It is primarily indicated for the maintenance treatment of schizophrenia and other psychotic disorders in patients requiring prolonged neuroleptic therapy, functioning as a dopamine D2 receptor antagonist to mitigate positive symptoms such as hallucinations and delusions while also exhibiting sedative and antiemetic properties. Its extended-release mechanism reduces dosing frequency, enhances medication adherence, and stabilizes plasma concentrations, making it particularly suitable for chronic management in non-adherent or severely ill populations.

The global Fluphenazine Decanoate market size was estimated at USD 330.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
