Abstracts

Fly ash chelating agents are specialized chemical formulations designed to bind and stabilize heavy metals and other potentially hazardous elements present in fly ash, a byproduct of coal combustion in power plants; these agents function by forming stable, water-insoluble complexes with metal ions such as lead, cadmium, arsenic, and mercury through chelation, a process involving the formation of multiple coordinate bonds between the agent's molecules and the metal contaminants, thereby reducing their leachability and environmental mobility, mitigating risks of soil and groundwater pollution, and facilitating the safe disposal, recycling, or beneficial reuse of fly ash in applications like construction materials, where regulatory compliance and environmental safety are paramount.

The global Fly Ash Chelating Agent market size was estimated at USD 142.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
