Report Overview:

The fly fishing rod is an extension of the arm throughout the fishing process. The material and process used in the production process of the rod determine the rebound frequency of the rod. The so-called bending of the rod is actually caused by the load of the main weight line on the rod during flight. The release frequency of the reaction force during the throwing process depends on the ductility and recovery of the material itself. The speed of the rebound frequency will seriously affect the speed of the throwing rhythm during the throwing process, that is, the rod with a slow rebound speed has a slow throwing rhythm and a long pause time; while the rod with a fast rebound speed can use a faster throwing rhythm To complete the false throw flight of the main line.
