Report Overview:

Flywheel energy storage (FES) works by accelerating a rotor (flywheel) to a very high speed and maintaining the energy in the system as rotational energy. When energy is extracted from the system, the flywheel's rotational speed is reduced as a consequence of the principle of conservation of energy; adding energy to the system correspondingly results in an increase in the speed of the flywheel.

Most FES systems use electricity to accelerate and decelerate the flywheel, but devices that directly use mechanical energy are being developed.

The Global Flywheel Energy Storage Systems Market Size was estimated at USD 166.82 million in 2023 and is projected to reach USD 263.25 million by 2029, exhibiting a CAGR of 7.90% during the forecast period.
