Abstracts

The amount of energy stored in flywheel energy storage products depends on the mass and rotation speed of the wheel body. The stored energy is directly proportional to the mass of the wheel body and squarely related to the rotation speed of the wheel body. In theory, it is easier to increase the stored energy by increasing the rotation speed, so the energy storage wheel body can be divided into low-speed wheel body with large mass and high-speed wheel body with small mass. The low-speed wheel body is usually made of alloy steel, and the speed is usually below 10,000r/min. The advantage is that the cost is low and the manufacturing difficulty is relatively small. The disadvantage is that it is large in mass and the installation location requires high load-bearing conditions. High-speed wheel bodies are usually made of carbon fiber, and the speed is usually above 10,000r/min. The advantage is small mass, but the disadvantage is high cost and relatively difficult manufacturing.

The global Flywheel Energy Storage Wheel Body market size was estimated at USD 385.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.35% during the forecast period.
