Abstracts

Foam-in-place Packaging System is a packaging solution that involves the on-site generation and application of foam to protect and cushion products. It typically consists of two main components: a liquid resin and a blowing agent. When these components are mixed and dispensed, they chemically react to form a foam that expands and fills the space around the product. This system offers custom-fit protection as the foam conforms to the shape of the item being packaged. It provides excellent shock absorption and can protect delicate or irregularly shaped products during transportation and storage. It is widely used in various industries such as electronics, ceramics, and glassware to ensure products arrive at their destinations intact.

The global Foam-in-place Packaging System market size was estimated at USD 261.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
