Abstracts

A foam surfboard is a type of surfboard constructed primarily from a lightweight foam core, often covered with a layer of soft, durable material like fiberglass or epoxy resin. These boards are typically designed for beginners or recreational surfers, as the foam construction provides extra buoyancy, stability, and a forgiving surface that makes balancing and paddling easier. Unlike traditional hard-top surfboards made from wood or fiberglass, foam boards are more forgiving, reducing the likelihood of injury when falling off or colliding with the board. Their soft surface also makes them more suitable for learners, offering a safer and more enjoyable experience in the water. Foam surfboards are popular for their durability, affordability, and ease of use.

The global Foam Surfboard market size was estimated at USD 527.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
