Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Foaming Mould competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Foaming mould is a mould used to produce foamed material products. Foaming mould can contain and shape foaming materials, such as polyurethane, polystyrene, etc., through special design and structure. The foaming material expands and solidifies in the mould through chemical reaction or physical action, and finally forms the desired product shape. The foaming mold market is currently in a stage of sustained growth. With the increasing requirements of lightweight, environmental protection and energy saving, the scope of application continues to expand. The demand for foaming molds mainly benefits from the widespread use of foaming materials such as polyurethane and polystyrene, which have good heat insulation, sound insulation and cushioning properties and are suitable for the production of various products. In the future, the foaming mold market will develop in the direction of intelligence and environmental protection. With the advancement of Industry 4.0, digital technology and automated production will improve the production efficiency and precision of foaming molds, reduce manual intervention, and improve product consistency. In addition, with the strictness of environmental protection regulations, green, recyclable materials and low-emission technologies will be widely used in the design and production of foaming molds, promoting the industry to move towards sustainable development. At the same time, with the increase in customized needs, foaming molds will pay more and more attention to personalization and diversification to meet the needs of different customers and markets.
