## Abstracts

Focused ion beam microscope is an instrument that uses a high-energy ion beam to scan the sample surface to achieve nanoscale imaging, etching, and deposition. Liquid metal ion sources (such as gallium ions) are used to generate field-induced ion emission under the action of a strong electric field to form an ion beam. Through an electric field lens system, the ion beam is focused to the nanoscale to achieve high spatial resolution. The high-energy ion beam scans the sample surface, exciting secondary electrons and secondary ions, and detects these signals to obtain an electron image, thus achieving imaging. The image resolution of commercial models has reached up to 4nm, which is not as good as scanning electron microscopes and transmission electron microscopes, but it has advantages in the analysis of fixed-point structures. Compared with scanning electron microscopes, focused ion beam microscopes do not require specimen preparation for the analysis of fixed-point structures, making them more economical. Focused ion beam microscopes are widely used in materials science, semiconductor manufacturing, biomedicine and other fields for nanoscale material characterization and processing. The growing use of focused ion beams for sample preparation and the growing demand for ion beam technology in lithography have driven the market. Focused ion beam technology can also be used for micromachining and imaging at the nano and micron levels, which further broadens its application areas. Liquid metal and gallium remain the main ion sources, with gallium being more commonly used as an ion source. The focused ion beam market can be divided into sample preparation, nanomanufacturing, and other sub-applications including biosciences. The focused ion beam microscope market will continue to grow in the next few years, mainly due to its wide range of applications and technological advances. However, the high price of the equipment remains the main factor limiting its further development.

The global Focused Ion Beam Microscope market size was estimated at USD 528.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
