Report Overview

The focused shock wave apparatus use an electromagnetically generated shock wave produced within a hand-held applicator (F-SW Hand piece). The shock wave is generated by discharging a high voltage capacitor located in the control unit into a cylindrically shaped coil system in the handpiece which is surrounded by a cylindrical metallic membrane. The transient magnetic field produced by the coil induces eddy currents in the metal membrane, causing it to repel from the coil, producing a pressure wave. The membrane is immersed in water and the pressure wave produced by the membrane propagates through the water to a concentric parabolic reflector, where it is reflected to a focal point outside of the handpiece in front of the reflector.

The global Focused Shockwave Therapy Apparatus market size was estimated at USD 312.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
