Abstracts

Folate metabolic genes test is a method of evaluating an individual's ability to absorb, utilize, and metabolize folate by detecting genes related to folate metabolism. Folate, also known as vitamin B9, is a water-soluble vitamin that is crucial for cell division and DNA synthesis, and can promote the development and health of the nervous and immune systems. The enzymes corresponding to folate metabolism related genes in the human body are involved in the transport, transformation, and storage of folate. The activity levels of these enzymes vary among individuals, leading to differences in their ability to absorb, utilize, and metabolize folate. Lack of folate may lead to health problems such as anemia and neural tube defects. Folate metabolic genes test is usually performed using PCR amplification technology or sequencing analysis. It can also be combined with serum folate concentration measurement to comprehensively determine an individual's folate metabolism, which is helpful for nutritional regulation and disease diagnosis.

The global Folate Metabolic Genes Test market size was estimated at USD 1820.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
