Report Overview:

Folic acid and folate are different forms of vitamin B9 that support healthy cell growth and development, especially in pregnancy. Folate is the natural form of vitamin B9 that occurs in various foods, such as leafy vegetables, beans, nuts, and eggs. Folic acid is the synthetic form of vitamin B9 that is used in supplements and added to fortified foods, such as bread, pasta, rice, and cereals. Folate is converted into the active form of vitamin B9 called 5-methyltetrahydrofolate (5-MTHF) in the digestive system before entering the bloodstream. Folic acid needs to be converted into 5-MTHF in the liver or other tissues, which is a slow and inefficient process in some people.

The Global Folic Acid and Folate Market Size was estimated at USD 166.86 million in 2023 and is projected to reach USD 231.38 million by 2029, exhibiting a CAGR of 5.60% during the forecast period.
