Abstracts

The follow-up grinding machine is a high-precision, highly automated grinding equipment that uses advanced follow-up control technology to adjust various parameters in the grinding process in real time to ensure that the shape, size and surface quality of the workpiece meet the expected requirements. Its core advantage is that it can sense the shape or position changes of the workpiece through sensors and control systems, and automatically adjust the position, feed rate or angle of the grinding head, thereby achieving precision machining of parts with complex shapes. Unlike traditional grinders, the machining process of the follow-up grinder not only relies on fixed working parameters, but also continuously adjusts the feedback system, so that even in the face of workpiece errors, clamping errors or irregular shapes, it can still maintain high-precision machining effects.

The global Follow-up Grinding Machine market size was estimated at USD 542.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
