Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Food Grade Antioxidants competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Food grade antioxidants is one of the commonly used additives in the food industry. It is used to delay the oxidation process of food and maintain the freshness, flavor and nutritional value of food. They mainly inhibit the production of cells or promote cell clearance, avoiding the occurrence of oxidation reactions, thereby improving the shelf life of food. In 2024, global Food Grade Antioxidants production reached approximately 215.94 K MT, with an average global market price of around US\$ 4367 per MT. The annual production capacity of a single production line is about 5,000 tons, and the gross profit margin of the product is about 25%. Food-grade antioxidants include natural plant extracts (such as vitamin C, vitamin E, tea polyphenols, quercetin, etc.) and synthetic chemicals (such as BHA, BHT, TBHQ, etc.). Natural antioxidants are often more popular among consumers, but synthetic antioxidants are widely used in large-scale production due to their low cost. The market demand for antioxidants is not only affected by prices, but also driven by consumer health awareness, environmental awareness and food safety requirements. Natural antioxidants have certain competitive advantages in the market, but their costs are high. With the advancement of technology, more efficient and affordable natural antioxidants may be developed in the future.

The global Food Grade Antioxidants market size was estimated at USD 943.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
