Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Food Grade Diacylglycerol (DAG) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of food-grade diglycerides was 282,000 tons, with an average price of US\$2,600 per ton. Food-grade diglyceride (DAG) is a functional oil whose core characteristic is that the diglyceride content is ≥40% (national standard requirement). It is mainly made by lipase-catalyzed natural vegetable oils (such as soybean oil and rapeseed oil). The upstream supply of food-grade diacylglycerol (DAG) mainly comes from suppliers of vegetable oils and fatty acid raw materials, including basic oil companies producing palm oil, rapeseed oil, and soybean oil, as well as refining companies that provide food-grade glycerol and fatty acid glycerides. Fluctuations in upstream costs directly affect the unit cost of DAG. Downstream applications are concentrated in food processing, baking, dairy, and functional food companies. Large bread and baking factories use DAG to improve texture stability and moisture retention; dairy companies use it as a structural lipid to replace some saturated fats to improve taste and fat distribution; plant-based food manufacturers use DAG to improve emulsification properties and oil dispersion; and functional food companies use it as a structural component in healthy oil formulations. The main drivers of downstream growth are health trends, the continued expansion of demand for baked goods, the rapid penetration of plant-based foods, and policy encouragement for trans-fat-free and low-saturated-fat products. Downstream companies have high requirements for food-grade quality, safety, clean labeling, and stability, which is continuously expanding the market space for high-purity DAG. The industry is evolving towards higher purity, lower odor, sustainability, and specialized structures. The stable supply of high-quality oils, advancements in fat structure

regulation technology, and the expansion of functional foods are jointly driving the rapid increase in DAG penetration. The driving forces include increased consumer awareness of healthy fat structures, the long-term trend of food companies replacing some traditional emulsifiers and oil structures, and policy support for nutritional improvement and weight-loss foods. The main obstacles are the unstable costs caused by fluctuations in vegetable oil raw material prices, the high technical requirements of DAG production necessitating a fixed quality control system, and the substitution pressure from similar oil modification technologies such as enzymatic structural lipids and other emulsifier systems. The annual output of a single production line is approximately 3,000-8,000 tons, with industry gross profit margins mostly between 12% and 22%.

The global Food Grade Diacylglycerol (DAG) market size was estimated at USD 733.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.90% during the forecast period.
