Abstracts

Food irradiation testing refers to the analytical procedures and technologies employed to detect, measure, and verify whether food products have undergone irradiation treatment, a preservation method that exposes food to controlled doses of ionizing radiation?such as gamma rays, X-rays, or electron beams?to eliminate pathogens, extend shelf life, and inhibit spoilage by disrupting the DNA of microorganisms; this testing relies on identifying specific physical, chemical, or biological markers (e.g., changes in lipid composition, DNA fragmentation, or the presence of radiolytic byproducts like 2-alkylcyclobutanones) that serve as reliable indicators of irradiation, ensuring regulatory compliance, verifying labeling claims, and upholding food safety and quality standards in global supply chains.
