## Abstracts

A Texture Analyser is a texture measurement system that moves in either an up or down direction to compress or stretch a sample. The travelling arm is fitted with a load cell and records the force response of the sample to the deformation that is imposed on it. Force, Distance and Time data is collected and usually presented as a curve on a graph which, when analysed, indicates the texture of the sample. Texture Analysers provide the operators with ultimate control and test flexibility for measuring all types of physical/textural properties of solid and semi-solid systems by their ability to accommodate a wide range of probes and fixtures (devices to test food structure) that can be attached to the Texture Analyser base and/or arm. A Texture Analyser is the source of ultimate objective quantification of whether the food is ‘more crispy, firm, sticky, etc. as a result of a new technique or the addition of a certain ingredient to the formulation.Texture analyzers are the ultimate source of objective quantification of whether a food is "crunchier, harder, stickier" etc. due to new technology or the addition of certain ingredients to the recipe. In addition to taste and smell, the texture (through touch) of food is also a key factor for the end customer. Cosmetics and pharmaceuticals are also highly sensory dependent and benefit greatly from texture analysis capabilities. The development of this market is facilitated in order to launch more products that are attractive to consumers.
