Abstracts

A food waste bio digester is an advanced anaerobic digestion system designed to convert organic waste, primarily from food scraps, into valuable byproducts such as biogas—a renewable energy source composed mainly of methane and carbon dioxide—and nutrient-rich digestate that can be used as a soil amendment or fertilizer. These systems operate by creating an oxygen-free environment where microorganisms break down organic matter through a series of biological processes, offering an environmentally sustainable alternative to landfilling or incineration. The technology can be implemented at various scales, from small-scale units for households or restaurants to large industrial systems for municipalities or food processing facilities, and is characterized by its ability to reduce greenhouse gas emissions, manage waste efficiently, and support circular economy principles by recovering energy and nutrients from organic waste streams.

The global Food Waste Bio Digester market size was estimated at USD 180.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
