Report Overview

Foraging for feed refers to the practice of sourcing and collecting natural, often wild or semi-wild, plant and animal materials to supplement or replace commercially produced animal feed. This method is commonly used in livestock farming, poultry production, and aquaculture to reduce costs, improve animal nutrition, and enhance sustainability by minimizing reliance on processed or synthetic feed products. The materials foraged may include grasses, legumes, insects, algae, and other organic matter that animals naturally consume in their habitats. The practice is particularly prevalent in small-scale farming, organic agriculture, and regions where commercial feed is expensive or logistically challenging to obtain. It aligns with growing consumer demand for ethically sourced, environmentally friendly animal products, though it requires careful management to ensure nutritional balance and avoid potential contamination from pesticides or toxins in wild sources. The increasing emphasis on regenerative agriculture and circular food systems has further boosted interest in foraging for feed as a way to enhance biodiversity, reduce waste, and lower the carbon footprint of animal husbandry.
