## Abstracts

A force feed lubrication system is a type of lubrication system that uses a pump to forcibly supply lubricating oil or grease to the friction points of mechanical components under pressure. It is also known as a pressure lubrication system. Compared to other lubrication methods like splash lubrication, which relies on the splashing of oil by moving parts, the force feed lubrication system can deliver lubricants more accurately and effectively to where they are needed. The force feed lubrication system operates by using a pump to draw lubricant from the reservoir. The pump then pressurizes the lubricant and forces it through the piping and hoses. The pressurized lubricant flows to the specific friction points of the mechanical components through nozzles or other dispensing devices. Some systems may also have a pressure regulator to ensure that the lubricant is supplied at the appropriate pressure. Excess lubricant may return to the reservoir through a return line for recycling and reuse.

The global Force Feed Lubrication System market size was estimated at USD 706.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
