## Abstracts

Forced-air kerosene heater is a heating device that uses kerosene as fuel and uses a forced-air system to improve heating efficiency. The combustion chamber is the main place for kerosene combustion. The combustion chamber is usually made of high-temperature resistant metal materials, such as stainless steel, and its design structure enables kerosene to burn fully and produce high-temperature gas. The fuel injector is responsible for atomizing the kerosene and spraying it into the combustion chamber. The atomized kerosene can be better mixed with the air, increasing the contact area of the combustion reaction, thereby improving the combustion efficiency. When the forced ventilation kerosene heater is started, the fan starts to work and forces the outside air into the combustion chamber. At the same time, the fuel injector atomizes the kerosene and sprays it into the combustion chamber, and the atomized kerosene is fully mixed with the air. The ignition device generates sparks or flames to ignite the mixed gas, and the kerosene burns in the combustion chamber, generating a large amount of heat and combustion products (mainly carbon dioxide and water vapor). It is used for heating in some small shops, restaurants, warehouses and other places. For example, in street shops without central heating, forced-air kerosene heaters can be an affordable way to provide a warm environment for customers and employees; in warehouses, it can prevent goods from getting damp or damaged due to low temperatures.

The global Forced Air Kerosene Heaters market size was estimated at USD 168.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
