Report Overview

A forced circulation boiler is a boiler where a pump is used to circulate water inside the boiler. This differs from a natural circulation boiler which relies on current density to circulate water inside the boiler. Forced circulation boilers typically have higher flow rates and provide a better heat transfer rate by ensuring a continuous flow of heated water to the parts of the system which require it. This results in better temperature control, improved thermal efficiency and higher production rates in various industrial processes. Forced circulation boilers are commonly used in power plants, petrochemical plants and other process industries, as well as in heating and cooling systems for buildings.
