Report Overview

Forced circulation is a form of technology that uses an external forced circulation pump to return materials to the equipment for recirculation. Evaporation crystallization boils and vaporizes the solution containing non-volatile substances through heat transfer to increase the saturation of the solution until the solute is precipitated in the form of solid crystals after supersaturation. The basic principle of the forced circulation evaporation crystallizer is to add a forced circulation pump to the original process to allow the material to evaporate repeatedly until the crystals are over-precipitated.

The global Forced Circulation Evaporative Crystallizer market size was estimated at USD 125.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
