Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Forged Railway Wheels competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A train wheel, or rail wheel, is a specialized type of wheel designed for use on railway tracks. It serves as the rolling element, usually pressed onto an axle and mounted directly onto a railway carriage or locomotive, or indirectly onto a bogie (UK) or truck (North America). The powered wheels of a locomotive are called driving wheels. Train wheels are initially forged or cast, followed by heat treatment to achieve the desired hardness. Compared to cast wheels, forged wheels offer superior internal quality and mechanical properties, making them highly suitable for demanding applications such as high-speed and heavy-haul trains. Most countries, including China, widely adopt the die forging and rolling method to manufacture forged train wheels.

The global Forged Railway Wheels market size was estimated at USD 1305.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
