Abstracts

Forged steel cryogenic valves are specialized industrial flow control devices designed to operate reliably in extremely low-temperature environments, typically below -40°C, with common applications reaching as low as -196°C or lower in industries like LNG processing, aerospace, and cryogenic storage; these valves are manufactured through a forging process that enhances the mechanical strength, density, and structural integrity of the steel, making them resistant to thermal contraction, embrittlement, and leakage under severe cryogenic conditions, and they often feature extended bonnets to keep packing and actuation components at ambient temperatures while the valve body interfaces with the cryogenic medium.

The global Forged Steel Cryogenic Valve market size was estimated at USD 312.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
