Report Overview

A forklift camera is a type of camera system designed specifically for use on forklifts and other types of industrial equipment. It typically consists of one or more cameras mounted on the forklift in strategic locations to provide the operator with a clear view of the surrounding area. Forklift cameras are used to improve safety and visibility, allowing operators to see obstacles, people, or other hazards that may be in their path. Some forklift cameras also come with additional features such as night vision or the ability to record footage for later review. Forklift cameras can be divided into traditional image acquisition cameras and embedded vision cameras. Embedded vision cameras are becoming more and more popular. To meet the growing demand for high-speed connections, a variety of flexible and powerful 3D camera interfaces are available on the market. Some of the most popular interfaces used by multiple industries include MIPI CSI-2, GMSL2, USB 3.0, and GigE etc. MIPI CSI-2 is one of the most common embedded vision interfaces. Even though it was developed for mobile devices, its 300 MB/s bandwidth makes it ideal for high-performance embedded vision systems. The maximum length of the MIPI CSI-2 cable is under 30cm, which solves application design challenges that involve a higher difference in distance between camera and processing systems. MIPI CSI-2 has four image data lanes that are each capable of 1.5Gb/s. MIPI CSI-2 is faster than USB 3.0. It's an efficient and reliable protocol that can handle video from 1080p to 8K and beyond. MIPI CSI-2 also uses fewer resources from the CPU because of multi-core processors. But in some cases, if a driver for the camera is not available, extra development costs can be incurred. The USB 3.0 interface has a much higher bandwidth than the USB 2.0 interface, up to 360MB/s. For embedded vision systems, USB 3.0 can be easily integrated with the USB3 Vision Standard. The plug-and-play functionality of USB 3.0 drastically reduces development

costs. It also enables embedded vision devices to swap out with ease – making it easy to replace a damaged camera. The USB has large connectors and fairly rigid cabling that may not be ideal for some compact embedded vision components. Most USB embedded vision cameras leverage the USB 3.1 Gen 1 interface to provide up to 5Gbit/s of image data bandwidth between the camera and the host system. USB 3.1 Gen 1 can simplify system design by supplying up to 4.5W of power to an embedded vision camera. The Ethernet interface, which is now mostly implemented as Gigabit-Ethernet (GigE), offers the broadest flexibility in terms of bandwidth, cable length, and multi-camera functionality. This interface can transfer data rates up to 120mb/s with a maximum cable length of up to 100m and can be integrated into all image processing applications. GigE provides up to 1Gbit/s of image data bandwidth and is available with robust shielding. GMSL is a multigigabit, point-to-point connection that predominantly targets the automotive space. A GMSL interface can carry high-speed video, bidirectional control data, and power over a single coaxial cable. The GMSL cameras can be placed 15 meters away from the host processor through coaxial cable and still support less latency and a high frame rate. GMSL supports multithreading and aggregate protocols like Ethernet and DisplayPort over a single link.
