Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Formamidinium Iodine-based Perovskite competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Formamidinium iodide perovskite (FAPbI₃) is a perovskite-type organic-inorganic hybrid semiconductor material. Formamidinium iodide perovskite belongs to the ABX₃ type perovskite structure, with FA⁺ occupying the A position, Pb²⁺ occupying the B position, and I⁻ occupying the X position. Under ideal conditions, a cubic or tetragonal phase structure is formed, but in actual preparation, it is easy to form a non-photoactive δ phase (yellow phase) or β' phase. The photoactive black phase (β phase) FAPbI₃ easily transforms to the δ phase at room temperature, and its structure needs to be stabilized by component regulation (such as adding Cs⁺, MA⁺) or interface engineering (such as two-dimensional perovskite template). By introducing additives such as pentamidine (PAD), the (001) crystal plane energy can be reduced, promoting the preferential growth of β phase FAPbI₃ along the vertical substrate direction, and significantly improving the crystallization quality and optoelectronic performance. As a candidate material for high-efficiency single-junction solar cells, formamidinium iodide-based perovskite can also be used in stacked cells (such as coupling with silicon-based cells) and flexible photovoltaic devices, promoting the development of photovoltaic technology towards high efficiency and low cost.

The global Formamidinium Iodine-based Perovskite market size was estimated at USD 63.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.30% during the forecast period.
