Report Overview

Fosetyl aluminium is a systemic fungicide widely used in agriculture to protect crops from diseases caused by oomycete pathogens, such as Phytophthora and Pythium species. It functions by inhibiting pathogen growth and stimulating the plant's natural defense mechanisms, making it particularly effective for high-value crops like fruits, vegetables, and ornamentals. The compound is often applied as a foliar spray, soil drench, or through irrigation systems, offering versatility in treatment methods. Due to its broad-spectrum activity and low toxicity to non-target organisms, fosetyl aluminium is favored in integrated pest management (IPM) programs. However, regulatory scrutiny on pesticide residues and increasing resistance in pathogen populations pose challenges to its sustained market growth. The demand remains strong in regions with intensive horticulture, such as Europe, North America, and parts of Asia, where high-value crop production relies on effective disease control solutions.

The global Fosetyl Aluminium market size was estimated at USD 198.97 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
