Report Overview

Fosfomycin calcium is a broad-spectrum antibiotic primarily used to treat urinary tract infections (UTIs) caused by susceptible strains of bacteria, including *Escherichia coli* and *Enterococcus faecalis*. It is available in both oral and injectable forms, with the oral formulation being more commonly prescribed for uncomplicated UTIs due to its convenience and efficacy. The drug works by inhibiting bacterial cell wall synthesis, making it effective against both gram-positive and gram-negative bacteria. Its unique mechanism of action reduces the likelihood of cross-resistance with other antibiotics, positioning it as a valuable option in cases where resistance to first-line treatments like fluoroquinolones or beta-lactams is a concern. The market for fosfomycin calcium is driven by the rising prevalence of UTIs, increasing antibiotic resistance, and the growing demand for effective treatments with a low risk of side effects. However, its use is somewhat limited by regional availability, regulatory approvals, and competition from other antibiotics. In emerging markets, cost-effectiveness and accessibility play a significant role in adoption, while in developed regions, its niche role in treating resistant infections supports steady demand. The competitive landscape includes both branded and generic manufacturers, with pricing pressures and patent expirations influencing market dynamics. Overall, fosfomycin calcium maintains a stable position in the antibiotic market, particularly in urology and infectious disease management.

The global Fosfomycin Calcium market size was estimated at USD 237.76 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
