Abstracts

Foundry lubricant is a type of lubricant that is specifically designed for use in foundries. Foundries are industrial facilities where metal is melted and poured into molds to create various metal products. The lubricant is used to reduce friction and wear between moving parts and surfaces in the foundry equipment, such as molds, cores, and other components. Foundry lubricants are typically formulated to withstand high temperatures and harsh operating conditions found in foundries. They are often made from synthetic or mineral oil-based materials and may contain additives to enhance their performance, such as extreme pressure (EP) additives, anti-wear agents, and corrosion inhibitors. The lubricant is applied to the surfaces that come into contact with each other during the metal casting process. It helps to reduce friction, prevent sticking or binding of the metal to the molds, and facilitate the smooth movement of components. This can improve the efficiency of the foundry operation, reduce downtime, and extend the lifespan of the equipment.

The global Foundry Lubricant market size was estimated at USD 1187.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
