Report Overview

Four channel constant flow atmospheric sampler (FCCAS) is an air sampler used to collect particulate matter in the atmosphere. It is designed for long-term continuous operation, which helps to monitor air quality for a long time. The working principle of FCCAS is to suck in air through four independent sampling channels, each of which is equipped with a filter to collect particulate matter. Use a pump and flow controller to maintain a constant air flow rate through each channel, ensuring that the collected samples represent the ambient air. The collected samples can then be analyzed in the laboratory to determine the composition of particulate matter and identify any pollutants present. FCCAS is often used in environmental research and monitoring projects to study the impact of air pollution on human health and the environment.
