Abstracts

A four ended signal booster is a specialized electronic device designed to amplify weak cellular signals across multiple frequency bands, typically featuring two external antennas for signal reception and two internal antennas for broadcasting, thereby enhancing voice, text, and data connectivity in indoor or remote environments by capturing, boosting, and redistributing signals from nearby cell towers. It functions as a bidirectional amplifier, improving both uplink and downlink communication for multiple users and devices simultaneously, and is commonly used in residential, commercial, or vehicular settings to mitigate issues like dropped calls, slow internet speeds, or poor network coverage caused by distance from towers, building materials, or geographical obstacles.
