In 2024, global four-probe tester production reached approximately 25,000 units, with an average global market price of around US\$10,000 per unit. A four-probe tester is an electronic test device used to accurately measure the resistivity and sheet resistance of materials, using a four-probe method to eliminate interference from contact resistance. Its principle is to apply a constant current to the surface of the material being tested, measure the voltage drop using two pairs of external probes, and calculate the resistivity based on geometric parameters. It is widely used in fields such as semiconductors, new energy, and materials science, ensuring high accuracy and repeatability.

The global Four-probe Tester market size was estimated at USD 256.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
