Abstracts

A four wheel steering (4WS) system is an advanced automotive technology that enables controlled steering of both the front and rear wheels, either in the same direction (in-phase) at higher speeds for enhanced stability during lane changes and cornering, or in opposite directions (counter-phase) at lower speeds to reduce the vehicle's turning radius and improve maneuverability in tight spaces such as parking lots or urban environments. By dynamically adjusting the rear wheel angle in response to steering input, vehicle speed, and other driving parameters, 4WS systems improve overall handling, agility, and safety, making them a key feature in premium passenger vehicles, high-performance sports cars, and certain commercial or specialty vehicles where precision control is prioritized.

The global Four Wheel Steering System market size was estimated at USD 1812.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
