## Abstracts

A Fourier Transform Infrared (FTIR) Analyzer is an advanced scientific instrument used to measure the infrared absorption spectra of materials. It works by shining infrared light through a sample and recording how much of the light is absorbed at different wavelengths. The analyzer uses a Fourier transform mathematical process to convert the raw data into a spectrum that reveals the molecular composition and structure of the sample. FTIR analyzers are widely used in chemistry, materials science, environmental analysis, and quality control for identifying chemical compounds, studying molecular vibrations, and analyzing complex mixtures.
