### Report Overview:

FT-IR stands for Fourier Transform InfraRed, the preferred method of infrared spectroscopy. In infrared spectrometer, IR radiation is passed through a sample. Some of the infrared radiation is absorbed by the sample and some of it is passed through (transmitted). The resulting spectrum represents the molecular absorption and transmission, creating a molecular fingerprint of the sample. Like a fingerprint no two unique molecular structures produce the same infrared spectrum. This makes infrared spectroscopy useful for several types of analysis.

FTIR spectrometers (Fourier Transform Infrared Spectrometer) are widely used in organic synthesis, polymer science, petrochemical engineering, pharmaceutical industry and food analysis. In addition, since FTIR spectrometers can be hyphenated to chromatography, the mechanism of chemical reactions and the detection of unstable substances can be investigated with such instruments

The Global Fourier-Transform Infrared (FTIR) Spectrometers Market Size was estimated at USD 319.99 million in 2023 and is projected to reach USD 395.63 million by 2029, exhibiting a CAGR of 3.60% during the forecast period.
