Abstracts

Fracturing Wellhead is a wellhead used for oil and gas production. It is mainly composed of casing head, tubing head and Christmas tree. It has pressure control ability, can increase oil and gas production, expand mining scope, optimize mining effect, and ensure the safety of fracturing operation. Fracturing wellhead technology uses high-pressure pump group to inject fracturing fluid into the oil and gas layer. When the pressure exceeds the bearing limit of the oil and gas layer, cracks will appear in the oil and gas layer. Subsequently, proppant (such as sand) is injected into the cracks to prevent the cracks from closing, thereby maintaining the high permeability of the oil and gas layer. Fracturing wellhead plays a vital role in the development of oil and gas fields. It provides strong support for oil and gas production by improving the permeability of the oil and gas layer.

The global Fracturing Wellhead market size was estimated at USD 727.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
