Report Overview

A frameless rotary motor is a type of electric motor that does not have a traditional frame or housing. It consists of a rotor and a stator without a physical boundary or structure connecting them. In a frameless rotary motor, the rotor is the rotating part of the motor, while the stator is the stationary part. The rotor typically contains permanent magnets, and the stator has the winding coils that generate the magnetic fields. When electric current flows through the stator windings, it creates a magnetic field that interacts with the permanent magnets on the rotor, generating torque and causing the rotor to rotate.
