Abstracts

A frameless torque motor is a specialized type of direct drive electric motor that eliminates the traditional housing, bearings, and shaft, instead consisting only of a rotor and stator that are integrated directly into the mechanical structure of the application. This design allows the motor to deliver high torque with exceptional precision, minimal cogging, and zero backlash, making it ideal for applications requiring high dynamic performance, smooth operation, and compact integration. By removing ancillary components, frameless torque motors reduce overall system weight, size, and inertia while improving stiffness and efficiency, and they are commonly used in robotics, aerospace, semiconductor manufacturing, medical devices, and high-performance industrial automation where direct drive solutions are preferred over traditional mechanical transmission systems.

The global Frameless Torque Motor market size was estimated at USD 350.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
