Abstracts

A free-standing grease separator is a device designed to remove fats, oils, grease (FOG), and sometimes solid particles from wastewater before it enters a drainage system or treatment plant. It operates by using the principle of density differences, where grease and oil, being lighter than water, float to the top while solids settle at the bottom. This separation helps prevent clogs in sewer systems, protects wastewater treatment facilities from damage, and reduces environmental pollution. Free-standing grease separators are commonly used in commercial kitchens, food processing facilities, and industrial settings to comply with environmental regulations and ensure proper waste management.

The global Free-Standing Grease Separator market size was estimated at USD 857.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.50% during the forecast period.
