Report Overview:

The freezing fat reduction apparatus uses the triglycerides in human body fat to be converted into solids at a low temperature of 5°C, and the precisely controlled freezing energy is delivered to the designated fat-melting site through a non-invasive freezing energy extraction device, and the designated fat-melting parts are eliminated in a targeted manner. The fat cells in the designated part make the fat cells in the designated part change from liquid to solid after being cooled to a specific low temperature, die after crystallization and aging, and are excreted through metabolism, and the fat in the body gradually decreases, so as to achieve local fat melting body sculpting effect.
