Abstracts

Frequency control ancillary services are a vital component of power grid infrastructure, playing a crucial role in maintaining the stability and reliability of the power system. It comprises a suite of services and mechanisms designed to monitor and adjust the grid frequency, ensuring it operates within a narrow range near its nominal value. Frequency control ancillary services come into play when the balance of power supply and demand fluctuates due to various factors, such as load changes, generator outages, or grid disturbances. These services combine rapid-response primary control (relying on the inherent characteristics of generators to quickly respond to small-scale frequency deviations) with more complex secondary and tertiary control (involving centralized coordination and economic dispatch of power generation resources). In addition, frequency containment and recovery reserves are maintained to cope with large-scale and sudden frequency disturbances, ensuring the grid can recover quickly and continue to operate smoothly, thereby providing a stable power supply for consumers and industries.

The global Frequency Control Ancillary Service market size was estimated at USD 887.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.90% during the forecast period.
