Report Overview

Frequency doublers are optical devices that convert input light at a specific wavelength into output light at half the wavelength (double the frequency) through nonlinear optical processes, often leveraging materials like lithium niobate (LiNbO₃), potassium titanyl phosphate (KTP), or beta barium borate (BBO). These devices are critical in applications requiring wavelength conversion, such as laser systems, telecommunications, medical imaging, and scientific research, where precise control over light frequency is essential. The market for frequency doublers is driven by advancements in laser technology, increasing demand for high-precision optical components in industrial and biomedical applications, and the growing adoption of nonlinear optical materials in photonics.
